Paragraph

A century ago, no humans went to Antarctica and now nearly two hundred people are there as a winter population. However, recent research from New Zealand government agency measures pollution problems in ice and snow. Although as compared to that of other region in the world, winteriness of Antarctica means that normal process of decomposition is obstructed. As a result, some laboratories are enveloped by the garbage of 6 decades operations. Despite accepted belief the icy land is really a desert with less drizzle than Sahara. In the past the garbage like beer cans or dead horse was covered by snow fall but now, due to global warming, the ice is diluting, and these are being sensitive. A decade ago, the countries using Antarctica admitted a peace agreement on waste clearance under which everything has to be given away to improve the situation. However, the researchers don't want to remove everything, in early 20th century the remains of early dispatches have gained cultural value will be secured.
